

9MW energy storage frequency regulation system project

Overview

What is frequency regulation in power system?

Frequency regulation in power system In power systems, frequency is the continuously changing variable which is influenced by the power generation and demand. A generation deficit results in frequency reduction while surplus generation causes an increase in the frequency.

Can Bess parameters be used in frequency regulation strategies?

Subsequently, using Taiwan's actual power system as the simulation background, N-1 simulations are conducted to explore the impact and benefits of BESS parameters when implementing frequency regulation strategies under two different BESS capacity specifications: 2 MW and 10 MW.

What is the frequency Nadir of a 2 MW power system?

In the 2 MW scenario, a comparison of the parameters from the three BESS units under frequency regulation strategies shows slight differences in the rise times of their output responses. However, for a 2 MW capacity, the frequency nadir in the power system remains consistently at 58.692 Hz.

Can a BES provide fr in an isolated power system?

Moreover, the SoC of the BES is re-established at a moderate rate of current when the frequency returns within the allowable limit. A similar rule based strategy, that dynamically adjusts the SoC limits, for the operation of BES providing FR in an isolated power system is proposed in Ref.

What is dynamic frequency support hybrid storage?

Dynamic frequency support requires continuous charging/discharging which involves partial charge/discharge events (detrimental to BES life). In addition, the required energy capacity can also be higher depending on the type of system. Thus, for dynamic frequency support hybrid storage is more suitable.

7. Research gaps and future directions.

How do power systems maintain frequency?

Power systems maintain frequency within the limits defined by grid codes by dynamically matching the generation and demand for secure operation. Large frequency excursions cause the tripping of loads and generators, which may lead to system collapse [, ,].
