

Communication base station inverter grid connection support

Overview

How do inverters work?

Inverters are also able to modulate their output power to support the utility grid interactively. Inverters react to changes in the utility grid by varying their power factor for example or by achieving an improved grid stability using other grid management services.

What are the requirements for smart grid interconnection of PV inverters?

The prerequisite for this is the smart grid interconnection of PV inverters with an advanced inverter function to the grid in accordance with the current UL 1741 SA "Grid Support Utility Interactive Inverters and Converters".

What happens if a grid-tied inverter exceeds a threshold?

If the grid voltage or grid frequency exceeds the thresholds specified by the grid operator, the grid-tied inverters must stop to feed in alternating current and disconnect from the utility grid in accordance with local standards and directives. Inverters are also able to modulate their output power to support the utility grid interactively.

How do I configure the functions of an inverter?

Value tested according to CPUC Rule 21 or tested average Depending on the product, the functions can be configured via the user interface of the inverter or a communication product (e.g. SMA Cluster Controller). Depending on the availability, the configuration can also be performed using SMA Modbus or SunSpec Modbus.

Why do we need PV inverters?

With the growth of the PV industry and a rising proportion of PV power in all over power generation, it becomes increasingly important that PV inverters make a significant contribution to improved grid stability and grid services.
