

Energy consumption formula of communication base station

Overview

In order to assess the power consumption of the network relative to its size, we introduce the notion of area power consumption as the average power consumed in a cell divided by the corresponding average cell area measured in Watts per square kilometer. How do you calculate energy consumption of wireless communication systems?

The first step when modeling the energy consumption of wireless communication systems is to derive models of the power consumption for the main system components, which are then combined with time-dependent traffic load models to estimate the consumed energy.

Do base stations dominate the energy consumption of the radio access network?

Furthermore, the base stations dominate the energy consumption of the radio access network. Therefore, it is reasonable to focus on the power consumption of the base stations first, while other aspects such as virtualization of compute in the 5G core or the energy consumption of user equipment should be considered at a later stage.

Is there a direct relationship between base station traffic load and power consumption?

The real data in terms of the power consumption and traffic load have been obtained from continuous measurements performed on a fully operated base station site. Measurements show the existence of a direct relationship between base station traffic load and power consumption.

How can a power consumption model be used to estimate power consumption?

Quantification models are most suitable for quantifying overall power consumption of base station or even networks as part of large-scale evaluations. The number and complexity of parameters is limited, and simple usage with load profiles or traffic models is possible to estimate total energy

consumption.

How do base stations affect mobile cellular network power consumption?

Base stations represent the main contributor to the energy consumption of a mobile cellular network. Since traffic load in mobile networks significantly varies during a working or weekend day, it is important to quantify the influence of these variations on the base station power consumption.

What is a LTE power consumption model?

The model by Auer et al. described in [1], was developed as part of the EARTH (Energy Aware Radio and neTwork tecHnologies) project. It is based on measurements of LTE hardware. Most notably, the model proposes a linear increase of power consumption with the output power (or load) of the base station.

Energy consumption formula of communication base station

Multi-objective interval planning for 5G base station virtual ...

With the rapid rise of 5G digitisation and its applications, as the core infrastructure connecting communication users and radio access networks, the construction scale of 5G base stations ...

[Product Information](#)

Energy consumption optimization of 5G base stations considering

An energy consumption optimization strategy of 5G base stations (BSs) considering variable threshold sleep mechanism (ECOS-BS) is proposed, which includes the initial ...

[Product Information](#)

On-site Energy Utilization Evaluation of Telecommunication ...

Since the sites we visited were all outdoors, there wasn't much more equipment consuming the energy besides the radio units and the base band units, therefore we constructed regression ...
