

Energy storage equipment to reduce peak loads and fill valleys

Overview

Do energy storage systems achieve the expected peak-shaving and valley-filling effect?

Abstract: In order to make the energy storage system achieve the expected peak-shaving and valley-filling effect, an energy-storage peak-shaving scheduling strategy considering the improvement goal of peak-valley difference is proposed.

How can peak shaving and valley filling improve energy consumption?

The practices of peak shaving and valley filling not only address the economic aspects of energy consumption but also enhance the reliability and sustainability of energy infrastructures.

What is the difference between valley filling and scheduled maintenance?

Scheduled Maintenance and Operations: Aligning energy-intensive processes to off-peak times can effectively lower the peak energy demand of a facility. Valley filling, conversely, involves increasing energy consumption during periods of low demand. This method is employed to help utilities manage energy loads more evenly across the day.

How is peak-shaving and valley-filling calculated?

First, according to the load curve in the dispatch day, the baseline of peak-shaving and valley-filling during peak-shaving and valley filling is calculated under the constraint conditions of peak-valley difference improvement target value, grid load, battery power, battery capacity, etc.

Does constant power control improve peak shaving and valley filling?

Finally, taking the actual load data of a certain area as an example, the advantages and disadvantages of this strategy and the constant power control strategy are compared through simulation, and it is verified that this strategy has a better effect of peak shaving and valley filling. How can smart metering and energy management systems help your business?

Smart Metering and Energy Management Systems: These technologies provide real-time data on energy usage, allowing businesses to adjust their consumption patterns accordingly. Scheduled Maintenance and Operations: Aligning energy-intensive processes to off-peak times can effectively lower the peak energy demand of a facility.
