Overview

What percentage of French electricity comes from wind and solar?

As a result of the development of renewable energy in 2023, wind and solar installations represented 14.6% of the French electricity mix. Wind power became the third-largest generator, behind nuclear and hydro power but ahead of gas.

Will France accelerate the development of offshore wind energy?

MPs voted on Tuesday the legislation intended to accelerate the development of these energies in France, but several points are the subject of debate. France's first offshore wind farm off La Turballe (on the Atlantic coast of western France), September 30, 2022. DAMIEN MEYER / AFP.

How do wind and solar power contribute to balancing electricity supply and demand?

Wind and solar power thus contribute to balancing electricity supply and demand, including at times of peak consumption. In November 2023, the government launched a public consultation on a document outlining the key directions of France's energy policy: the French Strategy for Energy and Climate (SFEC).

Where are France's wind farms located?

Nearly 60% of France's wind farm capacity is concentrated in the Hauts-de-France (northern France), Occitanie (southern France) and Grand-East (northeastern France) regions, which some residents feel is unfair. MPs plan to vote on the obligation to install solar panels in outdoor parking lots over 1,500 m² with penalties for non-compliance.
