

# **Hospital power generation station**

## Overview

---

Why do hospitals need a generator?

From life support equipment and intravenous dispensing systems to refrigerators that hold lifesaving medication, hospitals need a significant amount of power to keep moving in case of an emergency. Generators for health care industry applications must provide that power with consistent reliability.

Where should a generator be kept in a hospital?

Avoid keeping generators in hospital basements or on the roof. It's best to keep generators in weatherproof enclosures to limit exposure to the elements. Additionally, limit generator access to authorized personnel to prevent equipment tampering or damage.

What happens if a hospital generator goes out?

Typically, the law requires hospital backup generators to fully restore power within ten seconds of the initial outage. Any longer than that can cause serious harm to those on life support, including possibly the loss of life.

What happens if a hospital has a power outage?

A power outage in a hospital isn't just an inconvenience—it's a matter of life and death. To meet the strict regulatory mandates surrounding hospital backup power, hospitals must keep emergency generators well-maintained. Routine maintenance, testing, and timely repairs are crucial to ensure these backup power systems perform when needed most.

Why is hospital backup power important?

Reliable hospital backup power is essential to ensuring that these systems remain operational during an outage. Emergency generators step in immediately during a power failure, ensuring an uninterrupted electricity supply.

What happens if a hospital loses power?

If the facility loses power, a backup generator must turn on to prevent the refrigeration unit from raising the storage temperature of the medical supplies. If the temperature exceeds a specific level for a certain amount of time, which varies between vaccines and supplies, the hospital must discard the supplies.
