

How many base station sites are there

Overview

The number of global 5G base stations exceeded 3 million by the end of 2023. 5G base stations are growing at an extraordinary pace. By the end of 2023, more than 3 million were deployed across the globe. This figure represents a massive increase from just a few hundred thousand in 2019. How many base stations does the United States have?

By comparison, the European Union had around 460,000 thousand base stations, while the United States had approximately 175,000. Get notified via email when this statistic is updated.

What is a cellular base station?

A cell site, cell phone tower, cell base tower, or cellular base station is a cellular-enabled mobile device site where antennas and electronic communications equipment are placed (typically on a radio mast, tower, or other raised structure) to create a cell, or adjacent cells, in a cellular network.

How far can a mobile base station be from a base station?

In addition, some technologies, such as GSM, have an additional absolute maximum range of 35 km (22 mi), which is imposed by technical limitations. CDMA and IDEN have no such limit defined by timing. 5G (FR2) Mobile base station: the distances between the 5G base-station is about 250–300 m, due to the use of millimetre waves.

How many base stations are there in Europe?

By 2023, the continent had around 500,000 active base stations, with countries like Germany, the UK, and France leading the way. Unlike China and the U.S., Europe has emphasized widespread but steady deployment, focusing on balancing urban and rural connectivity. One challenge in Europe is regulatory hurdles.

What is a small cell base station?

Unlike traditional large cell towers, small cells are compact, low-powered base stations designed for dense urban environments. They help fill coverage gaps, improve network reliability, and handle high data traffic. In cities, more than 60% of 5G base stations are small cells, placed on rooftops, lampposts, and building facades.

Why do cities need more base stations than 4G?

In urban environments, this means installing 10 times more base stations per square kilometer compared to 4G. This presents both opportunities and challenges. On one hand, denser networks lead to better speeds and connectivity. On the other hand, deploying this many base stations requires significant investment and regulatory approvals.
