

# **Inverter voltage is higher than grid voltage**

## Overview

---

What happens if a solar inverter is too high?

Grid Voltage Rise Is Getting Worse. That's A Problem For Solar Owners If your inverter sees a grid voltage that is too high for too long, Australian Standards mandate it disconnects from the grid. Before the voltage is so high it disconnects, your inverter may also reduce its power output in response to high grid voltages.

Does a solar inverter increase a grid voltage?

In order for power to flow from your home to the grid, the voltage from the solar inverter has to produce a voltage that is a couple of volts higher than the grid voltage. Voila, Solar Voltage Rise. In the ideal situation, the voltage rise is not a problem: the inverter increases the grid voltage from 240 volts to 242 volts.

How many volts does a solar inverter produce?

Let's say it produces 10 amperes, and the grid has a resistance of 1 ohm. In this case, the voltage will rise to 220 volts at the inverter. If the solar inverter sees a high grid voltage of let's say 250 volts, it does the same. Only when the grid voltage exceeds some sane limit, will the solar inverter stop production.

Can an inverter export electricity to the grid?

For your inverter to export electricity to the grid, the voltage at your inverter must be slightly higher than the voltage at the grid to “push” the excess power to the grid. The higher the amount of electricity you are trying to export, the greater the “voltage rise” between your inverter and the grid will be.

What happens if a power inverter is over 250V?

The higher the amount of electricity you are trying to export, the greater the “voltage rise” between your inverter and the grid will be. If the voltage at your

inverter goes above 250V, the inverter will enter volt-watt response and reduce its maximum power output accordingly.

Should a power inverter be lowered if resistance is high?

To keep the equation balanced, if the resistance in your property's cable is high, either the voltage from your inverter will have to be higher, or the current to the street will have to be lower. But reducing the current is a stupid idea. If your inverter wants to send 20 amps back to the grid, then we should "let it flow".
