## Overview

---

What is the photovoltaic efficiency of single-junction perovskite solar cells?

Photovoltaic efficiency of single-junction perovskite solar cells and monolithic two-terminal perovskite-silicon tandem solar cells for the period 2013–2023. Data extracted from NREL data sheet. (2) During the past four years, we have seen only a small increase (<1%) in PCE, currently topping at 26.1% (USTC).

How do perovskites affect a solar cell?

Materials made of perovskites are prone to deterioration when interacting with environmental effects including, light, oxygen, moisture, and heat. Over time, this deterioration may cause the solar cell's performance and efficiency to decrease, which would ultimately affect the solar cell's long-term dependability and durability.

Are perovskite photovoltaics durable?

These practices are more difficult, but more important, than the simple pursuit of higher initial efficiencies. Perovskite photovoltaics have achieved high power conversion efficiencies, yet their durability remains to be proven. This Perspective presents a number of approaches with a view to addressing durability challenges.

What factors affect the stability of perovskite solar cells?

Furthermore, the instability of perovskite materials can cause problems like hysteresis, or variations in the solar cell's output voltage, and lower PCE. In this section, we will review the several factors that affect the stability of PSCs. Moisture intrusion is a significant challenge that can lead to the degradation of PSCs.

Can a hybrid technology improve the performance of a perovskite solar cell?

Hybrid techniques that combine vacuum deposition and solution processing are emerging as potential ways to get customizable film properties. Ongoing

research aims to improve the performance and scalability of these fabrication methods, paving the door for advances in perovskite solar cell technology.

Do perovskite PV modules change efficiency during the day?

For example, perovskite PV modules can change in efficiency throughout the day, and this change reverses at night 32. The lack of established preconditioning protocols for perovskite PVs makes it impossible to accurately interpret the results of an accelerated stress test.
