

# **Photovoltaic panel current exceeds the range**

## Overview

---

What is the maximum voltage a solar panel produces?

The maximum voltage a solar panel produces under standard test conditions with no load connected. It is used to calculate the maximum possible string voltage, especially in cold conditions. This value is listed on the solar panel's spec sheet and is crucial for calculating string voltage.

What happens if I exceed the PV array input current limit?

If you exceed the PV array input current limit AND connect the PV array in REVERSE POLARITY, then there is likelihood of damage to the MPPT, and this damage is not a manufacturing fault and will not be covered by warranty.

What is the maximum open circuit PV voltage?

PV array The maximum open circuit PV voltage can not exceed 150 or 250V, depending on the solar charger model. The nominal PV voltage should be at least 5V higher than the battery voltage. The PV array can consist of mono- or poly-crystalline panels.

What is the difference between voltage and current for solar panels?

Maximum Power Voltage ( $V_{mp}$ ): This is the voltage at which your panel operates most efficiently. If voltage is pressure, current (measured in amps) is the flow rate. Voltage is how steep the river is, while current is how much water flows past you each second. Some key points about current for solar panels:.

How many volts can a solar panel handle?

If your unit is rated at 360 Volts @ 15 amps then you need to adhere to the specs. Series your panels to get the voltage up to 300 volts. I would not exceed the 15 amp max if that is the specification. That is not the load but the maximum input current that the unit can support. If you exceed that then you can possibly damage your equipment.

Can a PV array exceed MPPT's operating current limit?

Which is where the  $I_{sc}$  limit comes into play. One needs to consider what happens if something goes wrong, such as a short circuit. It's perfectly fine to design a PV array to exceed the MPPT's operating current limit, however do not exceed the MPPT's  $I_{sc}$  limit. See here for examples:
