

# **Principles of wind power technology for powering communication base stations**

## Overview

---

Can wind energy be used to power mobile phone base stations?

Worldwide thousands of base stations provide relaying mobile phone signals. Every off-grid base station has a diesel generator up to 4 kW to provide electricity for the electronic equipment involved. The presentation will give attention to the requirements on using windenergy as an energy source for powering mobile phone base stations.

What are the primary sources of power for a mobile base-station?

The primary sources of power for these mobile base-station vary by region and can generally be categorized into 3 buckets: Reliable grid power: AC mains or grid power can reliably serve as the primary power supply.

What is the main source of power for a base station?

In the case of base stations situated in regions with bad-grid or off-grid power availability, the predominant source of power for the base stations is diesel generators. [4,6] Diesel generation is costly in both the procurement of fuel and travel required to maintain adequate fuel levels at the base stations.

Why do off-grid telecommunication base stations need generators?

As the incessant demand for wireless communication grows, off-grid telecommunication base station sites continue to be introduced around the globe. In rural or remote areas, where power from the grid is unavailable or unreliable, these cell sites require generator sets to provide power security as prime power or backup standby power.
