Overview

What is a solar inverter & how does it work?

A solar inverter is one of the most critical components of a solar power system. After harnessing sunlight and converting it into DC power by the solar panels, we still need one crucial step before we can use this power: conversion to AC. That's where the solar inverter comes into play.

Can solar inverters be installed outside?

Conversely, installing solar inverters outside exposes them to the harsh elements, which may shorten their lifespan and reduce long-term reliability. The challenge becomes more significant if the region experiences harsh weather conditions, such as extreme heat, snow, or heavy rain.

How does solar power work?

Solar power is a straightforward process. Photons emitted by the sun are absorbed by semiconductor materials in photovoltaic (PV) cells. This generates a flow of electrons which are converted and stored in batteries as potential energy. An inverter makes the stored power usable. Simple, right?

Off-Grid Vs. Grid-Tied Systems.

Can a small Solar Array run a greenhouse?

You can start small — you don't have to cover your entire roof with solar panels. A compact off-grid solar array is a fantastic solution for RVs and campers, and can be an easy way to run power to an outbuilding. A small solar array can provide convenient power to a remote location, like our greenhouse. It will reduce your carbon footprint.

Can solar inverters survive winter?

Solar inverters can endure cold, but not the problems often accompanying frost and snow, such as water ingress and damage from falling icicles. Position

the inverter accordingly and provide winter protection if necessary. Are Solar Inverters Waterproof?

.

Do solar inverters need a surge/lightning protection device?

Solar inverters, due to their outdoor location, are particularly susceptible to such surges. Protecting it with a surge/lightning protection device helps safeguard your investment. The device installation depends heavily on your site-specific attributes.
