

# What is Wind Solar Storage and Transmission

*LiFePO<sub>4</sub> Battery, safety*

*Wide temperature: -20~55°C*

*Modular design, easy to expand*

*The heating function is optional*

*Intelligent BMS*

*Cycle Life: ≥ 6000*

*Warranty: 10 years*

## Overview

---

How do solar and wind power systems work?

Solar and wind facilities use the energy stored in batteries to reduce power fluctuations and increase reliability to deliver on-demand power. Battery storage systems bank excess energy when demand is low and release it when demand is high, to ensure a steady supply of energy to millions of homes and businesses.

Do storage technologies add value to solar and wind energy?

Some storage technologies today are shown to add value to solar and wind energy, but cost reduction is needed to reach widespread profitability.

How do energy storage systems work?

This is where energy storage systems come into play. Large batteries can store energy when production is high and release it when demand soars, ensuring a consistent power supply. Innovations like lithium-ion batteries and pumped hydro storage are proving critical in balancing the supply and demand of renewable energy.

How does wind energy work?

This trend points to a significant move away from the environmentally harmful practice of burning fossil fuels. Wind energy works by using the aerodynamic force from rotor blades, which are somewhat similar to a plane's wings. When wind flows across these blades, it creates lift (like airplane wings) and drag (resistance).

How does energy storage affect the selling price of solar energy?

The average selling price without storage is lower for wind than solar, but as the energy storage increases in size (per unit rated power of solar or wind generation), the pricing distribution and mean selling price become increasingly similar across the two energy resources (Supplementary Figs

6-8).

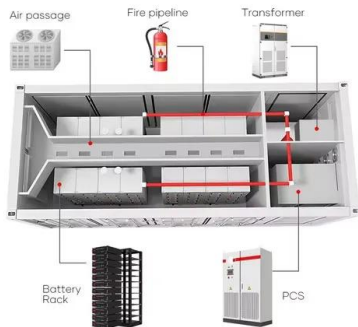

Does storage increase the value of a solar or wind plant?

Storage can increase the revenue generated by a solar or wind plant, but it also increases the capital costs of the plant. Here we optimize both the discharging behaviour, as done above, and the storage system size, to maximize the value of the electricity generation.
