

What is the maximum capacity of a photovoltaic inverter

Overview

Under the Clean Energy Council rules for accredited installers, the solar panel capacity can only exceed the inverter capacity by 33%. That means for a typical 5kW inverter you can go up to a maximum of 6.6kW of solar panel output within the rules. How much solar power can a 5kw inverter produce?

How big should a solar inverter be?

Getting the inverter size right depends on two key factors: Inverters work most efficiently when operating near their maximum capacity and are typically sized to be roughly the same size as your solar panels. Inverters are usually sized lower than the kilowatt peak (kWp) of the solar array because solar panels rarely achieve peak power.

What happens if a solar inverter reaches a maximum power point?

When the DC maximum power point (MPP) of the solar array — or the point at which the solar array is generating the most amount of energy — is greater than the inverter's power rating, the "extra" power generated by the array is "clipped" by the inverter to ensure it's operating within its capabilities.

Is there a difference between inverter size and solar panel capacity?

However, this should always be within the recommended ratio. This is the reason why you may see a 'mismatch' between inverter size and solar panel capacity – for example, a 6.6kW system advertised with a 5kW inverter.

How much power does an inverter need?

It's important to note what this means: In order for an inverter to put out the rated amount of power, it will need to have a power input that exceeds the

output. For example, an inverter with a rated output power of 5,000 W and a peak efficiency of 95% requires an input power of 5,263 W to operate at full power.

Why are solar inverters sized lower than kilowatt peak?

Inverters are usually sized lower than the kilowatt peak (kWp) of the solar array because solar panels rarely achieve peak power. The solar array-to-inverter ratio is calculated by dividing the direct current (DC) capacity of the solar array by the inverter's maximum alternating current (AC) output.
