

Why is the power supply of the communication base station negative 48V

Solar Panel

Hybrid Inverter

Lithium Battery

Battery Cabinet

Overview

What is a -48V power supply system?

Products basically use -48V power supply system, and the actual measured voltage is generally -53.5V. This is because for reliability reasons, communication equipment is equipped with a backup battery (-48V). In order to ensure reliable charging of the battery, the supply voltage needs to be slightly higher than the battery voltage.

What is a negative 48VDC?

Negative 48VDC (-48V), or positive grounded, was selected for use by Bell when it was found to be superior to positive voltage. It prevents electrochemical reactions from destroying buried copper cables and rendering them useless if they happen to get wet. Negative voltage also protects against sulfation on battery terminals.

What are the advantages of a negative 48V DC source?

An advantage of negative 48V is that four 12V batteries connected in series create 48V DC usable as a backup power source. Central telecom stations are known to have elaborate arrays of 48V battery banks. One important aspect of telecom power installations is that the polarity of the 48V DC source is setup to be negative with respect to ground.

What power supply is used in a central office communication system?

Later, in order to be compatible with early equipment and reduce costs, the central office communication equipment still used -48V power supply. Likewise, with a negative power system, the positive ground is just a convention. It turns out that there is a saying that there are a lot of negative charges in the air.

Which switch is rated for negative 48V?

NOTE: The only switch we make that is rated for negative 48V is our

WS-26-400-IDC. The power supply in it has polarity protection so if you hook it up backwards it simply will not power up and not harm it.

What is the operating voltage range for -48V system equipment?

For -48V system equipment, the required operating voltage range is -38.4V ~ 57.6V, but in fact we generally require the operating range -36V ~ -72V. The main consideration is that -48V system equipment must be compatible with -60V power supply system, which requires -48~-72V.

Why is the power supply of the communication base station negative

[Why does the communication power supply use DC-48V?](#)

In the -48V power supply system, the AC mains is converted to DC 54.5-55V by a switching power supply after low-profile operation, which is then used to float charge the ...
